

PRESS RELEASE

JUNE 2001

Introducing Sound Of The Web, a new media sound development company.

Sound Of The Web is dedicated to making a big impact on web designers and new media agencies that are looking for a pro-audio solution for their interactive projects, whether it's on or off-line.

Since its birth the Internet has developed in a way that few could imagine - we are now seeing more and more high bandwidth users who thrive on rich web content. Audio content is now in high demand and we offer the solution.

Sound Of The Web is offering a wealth of sound production services including composition, voice-over solutions, sonic branding, effects, encoding and mastering using our very own digital recording facility. Our engineers are experienced musicians, with a background in the new media field, so the results are always kept to an extremely professional standard.

The company launch coincides with the release of the Sound Of The Web Sample-ROM Volume 1, an interactive cross-platform CD-ROM with more than 890 effects and musical loops produced solely for the new media industry.

The Sample-ROM is an ideal tool to accompany any mainstream developer product such as Macromedia Flash or Director. Samples can be browsed, looped, searched and auditioned in what can only be described as a unique and extremely easy to use interface. The samples can then be downloaded to a desired directory on your computer.

LEFT :: Sample-ROM Volume 1

Sound Of The Web's internet presence (www.soundoftheweb.com) showcases the possibilities of audio content for the internet and also demonstrates the Sample-ROM and offers online samples off the CD-ROM for download. Naturally the site has been produced using Flash, to offer rich interactive content. Online secure trading is also offered for the purchase of the Sample-ROM via our Netbanx server.

Take a look at www.soundoftheweb.com for further information.
